

What is Spondylosis?

Spondylosis deformans is a degenerative, non-inflammatory condition of the spinal column characterized by the production of bone spurs along the bottom, sides, and upper aspects of the vertebrae of the spine. These bone spurs are simply projected growths of bone, usually grown in response to aging, or injury. [Click Here for full article](#) (PetMD.com)

Dylan's X-Ray – look at the bony spurs coming off the vertebrae..

Dylan is so much more comfortable following his swim sessions..
